endophthalmitis caused by Candida tropicalis. We describe a case of endogenous endophthalmitis caused by Candida tropicalis. Endogenous endophthalmitis in a diabetic patient developed 2 weeks after the urinary tract infection. The visual acuity was finger counting and intraocular pressure was 31 mmHg. Intravitreal antibiotic therapy was successful. In contrast to other cases reported, this patient did not have any risk factors predisposing him to endogenous endophthalmitis.CRD1 is associated with obesity and affects Rho-A signaling in adipose tissue and liver. GPR123, also known as CRD1 (chemoattractant receptor deficient-1), has been implicated in the pathogenesis of obesity-related metabolic disorders. We aimed to investigate the role of GPR123 in the regulation of adipose tissue function and liver lipid metabolism. CRD1 expression was examined in human and murine adipose tissue and mouse liver by quantitative real-time PCR, western blotting, immunohistochemistry and immunofluorescence staining. CRD1 expression was elevated in the fat of obese subjects and mice. CRD1 deficiency increased adipose tissue inflammation and altered the fatty acid profile in adipose tissue and liver. Ex vivo stimulation of human adipose tissue explants and 3T3-L1 cells with palmitate led to a 2-fold increase of CRD1 expression. CRD1 stimulation induced Rho-A activation, mTORC1 phosphorylation, p70S6K phosphorylation and VEGF production. CRD1 inhibition by siRNA attenuated all of the effects of palmitate stimulation. We further found

that CRD1 deficiency in mice prevented high-fat diet-induced weight gain and liver steatosis.
