

Nothing serious, just an observation. If you have AutoCAD and have the Project Explorer open, then you can use the X / Y axis Z value. A: The help says that a point is at location (0, 0, 0). development of undesirable CAD. The mechanisms that generate atherosclerosis in this patient population may be different from those that contribute to atherosclerosis in a general population. Defining these characteristics may help to identify those at risk and further our understanding of the pathogenesis of atherosclerosis. These mechanisms, which include genetic factors and the use of oral contraceptives, may be responsible for the higher incidence of atherosclerosis in women with abnormal ECG. The results of the present study suggest that women with an abnormal ECG exhibit a higher prevalence of subclinical atherosclerosis as measured by carotid IMT. Although women with an abnormal ECG are at higher risk for cardiac events \[\[@B1]\], and heart disease is associated with an increased risk for atherosclerosis \[\[@B10],[@B16]\], the importance of IMT in predicting future risk of cardiovascular events in these patients is still unclear \[\[@B3],[@B14],[@B17]\]. A previous study that focused on factors that are traditionally associated with the risk of CAD, such as diabetes mellitus, hypertension, hypercholesterolemia, smoking and alcohol use, reported that none of these individual factors were associated with the presence of carotid plaque \[\[@B4]\]. A recent study demonstrated that the extent of atherosclerosis measured by carotid IMT was predictive of clinical events in subjects with abnormal ECGs \[\[@B18]\]. The results of the present study suggest that in women with an abnormal ECG, not only traditional factors such as hypertension, diabetes, smoking and hypercholesterolemia, but also the presence of carotid atherosclerosis, might be responsible for future cardiac events. Therefore, female patients with an abnormal ECG may require more aggressive preventive strategies, such as stress reduction and exercise \[\[@B19]\], and should be followed by a cardiologist or other specialists. A limitation of the present study was that the cohort included only Japanese women. Therefore, the results of the present study may not be generalizable to women outside Japan. Second, although the population with an abnormal ECG was older than the population without an abnormal ECG,
